Products and stock

From the first material to the sale, step by step: every screen, every box, and what the software does with it.

For owners, store keepers, production and sales staff. Read it once from top to bottom; after that, open the step you need. Every page of the software ends with a **Next step** box that says what to do next.

How every screen works

- **The menu**: Inventory, then one dropdown per kind of work: Setup (Start here is its first link), Materials, Products, Stock, Production, Sales, Purchase, Reports, Tools.
- **Saving**: the answer shows just above the Save button - green when saved, red when not, with each wrong box outlined red and its reason under it. What you typed stays.
- **Dates**: every date box opens the same calendar. A date that cannot be right is refused.
- **Lists**: SL numbers, Show N, search, pages, and an **Edit** button on each row.
- **Money** (costs, values, margins) shows only to people given "See stock costs and values".

Words used on the screens

Word	What it means
Store	A warehouse or room: raw store, packing store, main store, depot.
Material	Something you use up making products: flour, sugar, wrappers. Bought, made here, or both.
Product	Something you sell. Bought ready, made here, or both.
Base unit	What stock is counted in, set once per item: packet, kg, piece.
Bigger unit	1 bag = 50 kg; 1 carton = 24 packets. A pack can have its own price.
Recipe quantity	The quantity the recipe is written for: "the recipe is for 240 packets". Make any amount: 1,300 packets takes every material x 5.42.
Batch number	Stock that came in together - one purchase line or one production - with its own dates and cost. The one that expires first always goes out first.
Cost of one	What one unit really costs: the last price paid (or the average, as Inventory settings say), or for a made item, its recipe and costs.
Margin	Sale price - cost of one. Below cost = a loss on each one sold.
Guarantee / Warranty	Guarantee: the first months, a faulty unit is replaced. Warranty: after that, to its end, it is repaired.

The one rule about prices
You do not type a buy price or a sale price when you add a material or a product. The **buy price** comes from **Stock in** (what you really paid). The **sale price** is set once the cost is known: on a Stock in line, or on the item's page, where the cost and the margin are shown. A price below cost is refused unless you switch on **Sell below cost** and say why.

The whole workflow in one example

A biscuit factory. **One batch** makes **240 packets** and uses flour 18 kg, sugar 5 kg, 240 wrappers and 10 cartons. Part A is done **once**; Part B **every time** you buy, make and sell.

Part A · Once: set up

#	Where you click	What you type or choose	What you see
A1	Inventory → **Setup** → Units, Stores	Units: Add standard units. Stores: Raw store, Packing store, Main store, each in its branch.	The units (KG, PCS, BAG, CARTON ...) and the rooms stock is kept in.
A2	Inventory → **Materials** → Materials → **Add material**	How you get it: Bought. Type: Raw material. Name: Flour. Base unit KG; Purchase unit BAG, Contains 50. Minimum stock 200. Batch tracking + Expiry tracking, shelf life 180 days. **No price.**	"RM-0001 Flour added". Next step: **Put it in stock**.
A3	Inventory → **Products** → Products → **Add product**	How you get it: Made here. Name: Biscuit 100 g. Base unit PCS; Selling pack CARTON, Contains 24. Minimum stock 5,000. Shelf life 180 days. New stock goes to: Main store. **No price.**	The product page opens and asks for its recipe.
A4	Product page → card **Recipe**	The recipe is for 240. Add material: Flour 18, Sugar 5, Wrapper 240, Carton 10.	"Recipe for 240 PCS", each line with its cost and how much of the product it is enough for.
A5	Inventory → **Setup** → Cost rates (optional)	Line worker 75 per hour; Oven 300 per hour. On the product: Add cost (people, machine, gas).	The full cost of the recipe's 240 and of one packet.

Part B · Every time: buy, price, make, sell

#	Where you click	What you type or choose	What you see
B1	Inventory → **Stock** → Stock in → **Stock in**	A purchase; supplier; Into store: Raw store; date. Line: Flour 10 BAG, cost 2,600 per BAG, manufacture date and/or expiry. Sale price: empty (flour is not sold).	"GRN-...: received into Raw store". The buy price is now known; Flour shows OK.
B2	Product page → card **Sale price**	Cost of one PCS is shown (e.g. 14.20). Margin you want: 30 % → the price fills (20.29). Change it to 20 and **Save price**.	"Now 20.00 per PCS" with its margin. The carton's own price: Units and prices → Add a unit.
B3	Product page → **Make this**	How much to make: 1,200 PCS (any amount); date; into Main store. **Plan it**.	Each material: needed, in stock, Enough or **Short by**.
B4	Production page → **Start: materials out**	Change a quantity only if the store gave more or less.	The materials leave the stores.
B5	Production page → **Finish: into stock**	Good 1,180, Damaged 20, into Main store. Expiry empty: made date + shelf life.	A new batch in Main store, at its real cost per packet.
B6	Inventory → **Sales** → Sell → **New sale**	Customer, From store, date. Line: Biscuit 10 CARTON, price empty. **Sell and deliver**.	"SO-... delivered as DC-...". Stock goes down from the batch that expires first.

Next time
Only Part B: Stock in when goods arrive, Make when you produce, Sell when you sell. Change a price whenever the cost changes - the item's page always shows the cost and the margin.

Step 0 · Start here

Where: Inventory → Setup → Start here

What it is: The first page: tiles (low or out, value in stock, set-up steps done), the **What to do** checklist and the latest productions.

The checklist is worked out from your own records - nobody ticks it - and each line opens its page: stores set up, materials added, products added, recipes saved, stock in, first production finished, first sale delivered. It is for setting up only: after that you go straight to Stock in, Make and Sell.

Step 1 · Setup

Where: Inventory → Setup

What it is: The lists everything else uses. Done once; changed rarely.

Page	What you add
Units	**Add standard units** adds KG, PCS, BAG, CARTON ... ; or add your own (code, name, decimals).
Item categories	Groups for lists and reports, one type each: Dry goods (raw), Wrappers (packaging), Biscuits (products).
Stores	Each store: its branch, code, name and type - raw, packaging, finished goods, quarantine, rejected.
Bins	Optional shelves or racks inside a store.
Inventory settings	Average cost for the whole company or per store; **Cost used for prices and recipes** (the last price paid, or the average); expiry warning days; label sizes; **Warranty** on or off (off by default).
Suppliers, Customers	Who you buy from and sell to (code, name, payment terms, credit limit).
Price lists	Optional: a customer's own prices; Sell uses them first.
Cost rates	What an hour of a worker or a machine costs (Production).

Step 2 · Materials

Where: Inventory → Materials → Materials → Add material Only with Production on.

What it is: What you use up making products: raw materials and packaging. The list shows each one with what is in stock, minimum stock, value and a chip: **OK**, **Low**, **Out**, and **Below cost** when it is sold for less than it costs.

You need first: units, categories and stores (Setup).

Item

Box on screen	What to write	What it does
How you get it Required	Bought, Made here, or Both. e.g. Bought	Made here or Both: it gets its own recipe and cost, and is made with Make (a cream made in-house).
Type Required	Raw material or Packaging. e.g. Raw material	Decides the categories offered.
Material name Required	What everyone calls it. e.g. Flour	Shown on every list, document and label.
Item code Optional	Leave it empty, or write your own. e.g. RM-0012	Empty: the next number is given.
Category Required	One of the material categories. e.g. Dry goods	Groups it in lists and reports.

Units

Box on screen	What to write	What it does
Base unit Required	What stock is counted in. e.g. KG	Fixed once stock has moved.
Purchase unit / Contains Optional	A bigger unit you buy in, and how many base units it holds. e.g. BAG, 50	Stock in can take bags; stock stays in kg.

Stock control

Box on screen	What to write	What it does
Minimum stock Optional	The least you want in stock. e.g. 200	Below it: Low, in the reorder report.
Reorder quantity Optional	How much you usually order at once. e.g. 500	Suggested on purchases.
Default store Optional	Where it is normally kept. e.g. Raw store	Production takes from this store first.
Expected buy price Optional	Only an estimate, before the first purchase. e.g. 52 per KG	Lets a product be costed early. The real price always comes from Stock in.

Batches & expiry

Box on screen	What to write	What it does
Batch tracking Optional	On for food, chemicals ... e.g. on	Each delivery gets its own batch number.
Expiry tracking / Shelf life Optional	On when it expires; the days it keeps. e.g. on, 180 days	Expired stock is never used. Shelf life fills the expiry from the manufacture date.
QC before use Optional	On when new stock must be checked.	New stock waits until it passes.

Warranty (only when Warranty is on)

Box on screen	What to write	What it does
Warranty (repair) Optional	The supplier's warranty, in months. e.g. 12	Runs from the day it was received.
Guarantee (replace) Optional	Its first months, when the supplier replaces. e.g. 3	Never longer than the warranty.
Serial number per unit Optional	On when each unit has its own number.	Units are entered one by one.

After Add material
The material's page opens with **Put it in stock**: Stock in, with this material already on line 1. **Edit** (on its page or its row in the list) opens the same form again.

Step 3 · Products

Where: Inventory → Products → Products → Add product

What it is: What you sell. The list shows how you get each one, what is in stock (also in packs), the sale price, the cost of one, the margin and a chip - **Below cost** when its price is under its cost.

Item

Box on screen	What to write	What it does
How you get it Sometimes	Made here, Bought ready, or Both. e.g. Made here	Only with Production. Made here and Both get a recipe, its cost and Make.
Product name, Item code, Category Required	As for materials (code empty: FG-0001 ...). e.g. Biscuit 100 g	

Units

Box on screen	What to write	What it does
Base unit Required	The smallest unit you sell. e.g. PCS (packet)	Fixed once stock moves.
Selling pack / Contains Optional	A bigger unit you also sell, and its size. e.g. CARTON, 24	Its own price is set on the product's page (Units and prices).

Box on screen	What to write	What it does
VAT Optional	The VAT %, if any. e.g. 15	Used on invoices.

Stock control

Box on screen	What to write	What it does
Minimum stock as Optional	A quantity, or days of sales. e.g. Days of sales	
Minimum stock / Days of sales Optional	The quantity, or how many days of sales to keep. e.g. 5,000 / 15	Below it: Low; also used to suggest how much to make.
Reorder quantity Optional	How much you usually make or buy at once.	
New stock goes to Optional	The finished goods store. e.g. Main store	Offered first when you make it.

Batches & expiry

Box on screen	What to write	What it does
Batch tracking / Expiry tracking / Shelf life Optional	As for materials. e.g. on, on, 180 days	A made batch expires on the made date + shelf life (or earlier, never later).
QC before use Optional	New stock is checked first.	

Warranty (only when Warranty is on)

Box on screen	What to write	What it does
Warranty (repair) Optional	Your warranty to the customer, in months. e.g. 12	Runs from the delivery date.
Guarantee (replace) Optional	Its first months, when a faulty unit is replaced. e.g. 3	Never longer than the warranty. After it, to the warranty's end: repair.
Serial number per unit Optional	On when each unit is scanned out.	See step 10.

Product page: tiles (cost of one, sale price, margin, in stock, sold per day); the **Sale price** card; how much to make; the recipe; its cost; stock by store and batch; units and prices.

The product's page, step by step
A bar at the top shows the steps in the order the work is done and stays in view as you scroll: **1 Details and units** → **2 Recipe** → **3 Cost** → **4 Sale price** → **5 Make** → **6 Stock and sell**. Done steps are green, the next one is blue; click a step to jump to it. A product that is only bought: Details → Stock in → Sale price → Stock and sell.
A step that needs an earlier one says so and points to it: the **Sale price** waits until the cost is known, **Make** waits for the recipe, and the recipe asks first what quantity it is for, then its materials.

Step 4 · Recipe and its cost

Where: The product (or a made material) → Recipe / Cost

What it is: The quantity the recipe is for, what it uses, and what that costs. It gives the cost of one unit. Any amount can be made later: the materials scale.

You need first: the product or material is Made here or Both.

1. With no recipe yet the page asks **what quantity the recipe is for** (for example the mix you usually make, 10,000 ML): write it and Save. It is only the formula: a production can be any amount.
2. **Add material**: choose **several materials at once** in the search list (type a few letters); each chosen one gets its own row: how much **the recipe** uses, in its own unit, and its normal wastage % (optional: empty is 0). Or make a new one right there (A new raw material or packaging item).
3. **Cost rates** (Inventory → Setup → Cost rates): what an hour of a worker or a machine costs.
4. **Add cost** (for the recipe's quantity): people x hours x rate, machine hours x rate, a fixed amount (gas), a % of the materials, or **VAT**: a % of the materials and every other cost, worked out last (15 % of 18,344.85 = 2,751.73).

What you read
Each material has its own row with its sum written out: **500 PCS + 10 % wastage = 550 PCS x 4.00 Tk = 2,200.00**. The cost of one unit of a material is the last price paid for it (or its average cost, as Inventory settings say), else its expected buy price before the first purchase.
Materials (the rows added up) + **other costs** (Add cost) = the cost of the recipe's quantity; divided by that quantity = **one unit** (the sum is shown: 3,206.00 / 500 = 6.41); x the pack size = **one pack**. A production of any amount costs the same per unit.
A material with no cost yet is named in red: buy it (Stock in) or give its expected buy price.

Step 5 · Stock in

Where: Inventory → Stock → Stock in → Stock in

What it is: Everything that comes into a store: a purchase, the first count, or a customer return.

You need first: suppliers or customers, and the items.

Box on screen	What to write	What it does
Where it comes from Required	A purchase, First count (opening stock), or A customer returned it - what each one means is written under the choice (see the box below). e.g. A purchase	Decides the boxes below.
Supplier / Customer Sometimes	Who it came from. e.g. Sweet Mills	
Into store, Date Required	The store and the day it arrived. Choose the store first. e.g. Raw store	The item lists then show only the items kept in that store. A closed month is refused.
Why it came back Sometimes	For a return. e.g. Wrong order	

Box on screen	What to write	What it does
Item, Quantity, Unit Required	One line per item; **Add a line** for more. e.g. Flour, 10, BAG	Only the item's own units are offered.
Cost Sometimes	What you paid, per the unit chosen (look at "Tk per ..." beside it). e.g. 2,500 per DRUM	Becomes the item's buy price: the next Stock in starts from it. Prices and recipes count its real cost (with its share of the delivery and VAT). The line total shows under it: 5 DRUM x 2,500 = 12,500.
Sale price (optional) Optional	A new sale price, now that the buy price is in. It shows the price now. e.g. now 60	Empty: the price stays. Below the new cost: refused unless Sell below cost.
Batch number Sometimes	From the label (items with batches). e.g. FL-231026	Empty: one is made.
Manufacture date Sometimes	From the label (items that expire). e.g. 1 Oct 2026	Not after the day it came in, and not a day still to come.
Expiry date Sometimes	From the label. e.g. 1 Apr 2027	Empty: manufacture date + shelf life. Never before the manufacture date.
Condition Sometimes	Return: good or damaged. e.g. Damaged	Damaged goes to the rejected store.
Sell below cost / Why below cost Optional	Only if a sale price below cost is meant. e.g. on, clearing old stock	Kept with the price change in the audit log.
VAT % / VAT amount Optional	A purchase only: the VAT on the bill, if you paid it. Write either one. e.g. 15	The other is worked out from the subtotal. Part of the goods' real cost, unless the company claims VAT back (Inventory settings).
Delivery / carrying cost Optional	A purchase only: transport, loading and unloading paid for it, in Tk. e.g. 1,550	Empty: none. Always part of the goods' real cost. Total paid = subtotal + VAT + delivery.

The three kinds of Stock in

A purchase (goods received): you bought it from a supplier and it arrived. Choose the supplier, write what the bill says it cost, and the VAT and delivery cost if you paid them. It makes a goods receipt (GRN).
First count (opening stock): stock you already had on the first day you use the software, counted on the shelf. Once per item, to start; after that stock comes in by purchase or production.
A customer returned it: a customer sent back what you sold. Good goods go back to stock, damaged ones to the rejected store. No cost is asked: it comes back at what it cost when it left.

On Put in stock

A purchase is received and posted at once; a first count is posted if you may approve opening stock, otherwise it waits; a return is posted. If any line is refused, nothing is saved - the line and the box are named.

The real cost: what the goods really cost you
The cost you write is the supplier's price. What you really paid also has the **delivery** and - unless the company claims it back - the **VAT**. Both are added to the goods, shared over the lines by their value, and each line goes into stock at its **real cost**. Recipes, the cost of one product, the price check and the profit all count the real cost.
Example: orange pulp 100 KG at 200 (20,000), sugar 50 KG at 120 (6,000), bottles 1,000 PCS at 5 (5,000). Subtotal 31,000; VAT 15 % = 4,650; delivery 1,550; **total paid 37,200**. 6,200 is added - one fifth of each line's value - so the real costs are **pulp 240, sugar 144, bottle 6.00**. Each line shows it under its total while you type: "real cost 240.00 Tk each".
A VAT-registered company that claims the VAT back sets Inventory settings → **VAT paid on purchases: We claim it back**: then only the delivery is added, and the VAT is kept apart on the goods receipt.
A goods receipt against a purchase order works the same way: its VAT comes from the order, and on the receipt page, card **Bill and real cost**, you write the VAT and the delivery cost before Post.
The next purchase starts from the supplier's price (200), not the real cost, so nothing is counted twice.

The line fills itself
Choose the item and the line is filled from what the software already knows: the **unit it is bought in** (a bag, a carton), its **cost** - the last price paid, else its expected buy price, for that unit - and above, its **usual store** and **last supplier**. Under the expiry box it says the date the shelf life will give. Usually only the **quantity** is left to type. Change anything that differs on the bill: what you type is never replaced.

Step 6 · Sale price

Where: The item's page → card Sale price

What it is: Set or change the price once the cost is known. The card shows the cost of one and the margin now.

You need first: a cost: a Stock in (bought) or a recipe (made).

Box on screen	What to write	What it does
Margin you want Optional	A %. e.g. 30	Fills the sale price: cost / (1 - 30 %).
Sale price Required	For one base unit. e.g. 20	The margin shows as you type; below cost shows red.
Sell below cost / Why Sometimes	Only when a loss is meant. e.g. on, expires next week	Without them a price below cost is refused. Kept in the audit log.

A pack's own price (a carton): Units and prices → Add a unit → Sale price of one pack - the same below-cost check, against the pack's cost.

Step 7 · Make: Plan, Start, Finish

Where: Inventory → Production → Make, or **Make this** on the item Only with Production on.

What it is: Making any amount - each production is one batch with one batch number: Plan it, Start it when the materials leave the stores, Finish it with what came out.

You need first: the recipe, and the materials in stock.

1. **Plan**: **how much to make** (any amount, in the product's unit), the date and the store. The recipe is scaled: a recipe for 10,000 ML, 125,000 ML to make, every material x 12.5. Each material shows needed, in stock, Enough or **Short by**. Short: **Make less**, **Buy the rest**, or **Make it first** (something made here). **Plan it**.
2. **Start: materials out**: change a quantity only if a store gave more or less (over 5 % needs a reason). Stock goes down at its real cost.
3. **Finish: into stock**: Good (what really came out, into stock) and Damaged (lost: never in stock). Good starts at the planned amount; **typing Damaged takes it off Good** (500 planned, 25 damaged: Good 475) and the store follows. Under Damaged: "475 good + 25 damaged = 500 came out, of 500 planned". Good + Damaged above the plan needs a reason. Then the store (or a split), leftovers back, other costs (the recipe's, scaled to the amount).
4. **Batch number**: one production is **one batch**, whatever its amount. Empty: the product code, the date and a counter - ORJ101-031126-1 for the first production of the day, -2 for the second; or type your own.

Dates of what is made
The manufacture date is the day it is made - never a day still to come. Expiry empty: made date + shelf life; typed: not before the made date and not after made date + shelf life.

The result
Cost of one = (materials used + other costs) / good. **Reverse** (with a reason) while nothing made was sold, moved or used.

Step 8 · Stock and Move stock

Where: Inventory → Stock → Stock / Move stock

What it is: Stock: every item, how much, where, its value and status, and what expires first. **Move stock**: send stock from one store to another. Adjustments and Stock counts (same dropdown) correct stock, with approval.

1. Move stock: From store, To store, date; each line item, quantity, unit and (if you want) the batch.
2. **Send it**: the stock waits **in transit**. The other store presses **Receive** on the Move stock list.

What is in a store: Inventory → Setup → Stores shows how many items each store holds; **What's in it** opens Stock for that store only ("What's in Raw store").

Step 9 · Sell

Where: Inventory → Sales → Sell → New sale

What it is: A sale, delivered at once from one store, invoiced when asked.

You need first: customers, and stock in the store.

Box on screen	What to write	What it does
Customer, From store, Date Required	Who, from where, when. e.g. City Shop, Main store	
Make the invoice now Optional	Tick to invoice at once. e.g. on	
Item, Quantity, Unit Required	Packet or carton. e.g. Biscuit, 10, CARTON	
Price Optional	Empty: the customer's price list, else the pack's price, else the product's.	Below the cost of what goes out: refused unless Sell below cost.
Why, if over the credit limit Sometimes	Only when the customer is over their limit.	
Sell below cost / Why below cost Optional	Only when a loss is meant. e.g. on, damaged boxes	The reason is written on the sale.

Sell and deliver: confirmed and delivered, the batch that expires first going first. More than the store has: refused, nothing saved.

Step 10 · Warranty

Where: Inventory → Tools → Warranty (only when switched on)

What it is: Serial numbers and claims.

You need first: Warranty on (Setup → Inventory settings), and months on the items.

1. **Serial numbers**: made when a production finishes; **Serial numbers in** for units you received; **Serial numbers out**: scan each unit on its delivery - the dates run from that day.
2. **New claim**: scan the serial (or choose the item and the delivery date). The form says which applies.

The form says	What you do
In guarantee until ...: replace	**Replace it**. Anything else (repair, refund) needs a reason.
In warranty until ...: repair	**Repair it** (its cost). Replace or refund needs a reason.
Out of warranty since ...	**Refuse** (say why), or cover it with a reason.

The faulty unit can go into the rejected store; a new unit leaves a store.

Reports
Inventory → Reports: production cost, material use, waste, shortages, stock on hand, valuation, batch and expiry, reorder, purchase and sales registers - each with filters, Excel and PDF; Month-end close beside it. Tools: Scan, Labels, Warranty.

Step 11 · Quality check

Where: Inventory → Stock → Quality check

What it is: An item with **Quality check before use** puts every new batch - made or bought - in quarantine: it is counted in stock but cannot be used, moved or sold until it passes.

You need first: an item with Quality check before use, and someone with "Record quality checks".

1. Open **Stock** → **Quality check** (Start here and the item's page also show what waits). Each row: the item, the batch, where it came from (Made · PRD-... or Bought · GRN-...), how much, the store and the expiry.
2. **Pass**: the batch is released at once - it can be used and sold.
3. **Fail**: write what failed; the batch is blocked. Bought goods go back with a purchase return; made goods are written off with a stock adjustment.

"I have 500 in stock but cannot sell it"
That stock waits for its quality check. Sell says so: "500 PCS of Orange juice in Main store waits for a quality check". Pass it on Stock → Quality check, then sell.

Step 12 · Buying with orders

Where: Inventory → Purchase → Requisitions / Purchase orders / Goods receipts / Quality check / Purchase returns

Small purchase, no approval? Stock in → A purchase is one step.

What it is: For buying that needs approval and a paper trail. Every purchase page shows the flow at the top - **Ask (optional)** → **Order** → **Receive** → **Quality check** → **In stock**, and **Return to supplier** - with its own step lit and, on a document, the next thing to press.

You need first: suppliers, items, stores.

1 · Ask to buy (optional): New requisition

Box on screen	What to write	What it does
Branch, Department Required	Who needs it. e.g. Head Office, Production	The approver of that branch decides.
Date, Needed by Sometimes	Today, and when it is needed. e.g. 5 Nov	
Why it is needed Optional	One line. e.g. Stock below minimum	
Lines: Item, Qty, Unit, Note Required	Add line for each item. e.g. Sugar 500 KG	

Submit → the approver presses **Approve** or **Reject**. Approved lines become an order: Purchase orders → **From requisitions**.

2 · Order: New order

Box on screen	What to write	What it does
Supplier Required	Who you buy from. e.g. Sweet Mills	One order per supplier.
For branch Required	Where it is delivered. e.g. Head Office	
Order date, Expected date Sometimes	Today; when it should arrive.	Late orders show as overdue.
Terms, Note Optional	Payment terms, anything for the supplier. e.g. 30 days	Printed on the order PDF.
Lines: Item, Qty, Unit, Unit price, Discount %, VAT %, Note Required	Add line for each item. e.g. Sugar, 500, KG, 125	The total shows on the order.

Send for approval → **Approve** → **Email to supplier** (or the PDF). Nothing is in stock yet. When the goods come: **Receive goods**.

3 · Receive: Goods receipt (GRN)

Box on screen	What to write	What it does
Order Optional	The order it comes against. e.g. PO-2026-00012	Lines fill from the order; the order shows what is still due.
Supplier, Store, Received on Required	Who sent it, into which store, the day. e.g. Raw store	
Challan no, Invoice no, Vehicle no Optional	From the supplier's papers.	Kept with the receipt.
Received / Refused at the gate Required	What came, what you sent back at once. e.g. 500 / 10	Only the accepted part goes in.
Unit cost Required	What you pay per unit. e.g. 125	Sets the average cost.
Batch no, Supplier batch no Sometimes	Items that keep batches. e.g. SG-1101	Empty: one is made.
Manufacture date, Expiry date Sometimes	From the label.	Expiry empty: manufacture date + shelf life.
Packages, Note Optional	Bags or cartons; anything. e.g. 10 bags	Package labels can be printed.

Post: the stock goes into the store. Items with a quality check wait on Stock → Quality check.

4 · Send back: Purchase return

Box on screen	What to write	What it does
Receipt, Supplier, Returned on Required	Which receipt it came on. e.g. GRN-2026-00007	
Why it goes back Required	Failed check, damaged, wrong item. e.g. Damp bags	
Lines: Received line, Item, Batch, Store, Bin, Qty, Unit, Note Required	What goes back. e.g. Sugar, 20 KG	Posting takes it out at the receipt's cost.

Step 13 · Selling with orders

Where: Inventory → Sales → Sell / Customers / Price lists, and Sales orders, Deliveries, Invoices, Sales returns

What it is: Sell (step 9) does order, delivery and invoice in one go. For an order that is delivered later or in parts, the documents one by one:

You need first: customers, stock, prices.

Sales order

Box on screen	What to write	What it does
Customer, Store, Order date Required	Who, from where, when. e.g. City Shop, Main store	
Delivery date, Source, Customer ref. Optional	When to deliver, how it came, their PO number. e.g. PO-7781	The ref. prints on the invoice and challan.
Delivery address Optional	Where it goes.	Empty: the customer's address.
Lines: Item, Store, Qty, Unit, Unit price, Discount %, VAT %, Note Required	Add line for each item. e.g. Juice, 10, CARTON	Price empty: the customer's price list, else the item's price. Store empty: the order's.

Confirm (over the credit limit needs a reason) → **Deliver**.

Delivery (challan)

Box on screen	What to write	What it does
Order, Store, Delivery date Required	Filled from the order.	One challan per store.
Vehicle no, Driver, Note Optional	Who carries it. e.g. Dhaka Metro-T 11-2233	Printed on the challan.

Box on screen	What to write	What it does
Lines: Batch, Bin, Qty Sometimes	Filled: the batch that expires first.	Another batch needs a reason.

Challan prints the delivery challan; **Post** takes the stock out; **Invoice** makes the invoice.

Invoice

Made from the delivery with its prices and VAT. **Issue** it, print the **PDF**, and mark it **Paid** (date and reference) when the money comes.

The invoice and the challan
Both print on your letterhead: logo, name, address, phone, email, BIN/TIN and registration number (Organisation → Company profile), the document's number, date and references in a box, Bill to and Ship to (or Deliver to), and the lines.
The invoice adds the subtotal, VAT and the total, the **amount in words** (Taka ... in lakh and crore), the payment terms and signature lines. A draft, cancelled or paid invoice says so across the page.
The challan adds batch and expiry, the total quantity and three signatures: store, driver and the customer (with seal).

Sales return

Box on screen	What to write	What it does
Delivery, Customer, Store, Date, Reason Required	What it came on and why. e.g. Leaking	
Lines: Delivery line, Item, Batch, Condition, Qty, Unit Required	Good or Damaged. e.g. Damaged, 2	Good goes back to stock; damaged to the rejected store.

Price lists

Box on screen	What to write	What it does
Name, Valid from, Valid to Required	One list, for some customers. e.g. Wholesale 2026	
Prices: Item, Unit, Price, Min qty Required	A price per unit, from a quantity. e.g. Juice, CARTON, 430, 10	Sell and sales orders take this price first.

Step 14 · Adjust stock

Where: Inventory → Stock → Adjustments → New

What it is: When you know the change for a few items: 5 damaged, 2 found, 10 expired. Each page shows which one you need, the steps with the current one lit, and what to press next.

You need first: someone else who may approve adjustments.

Box on screen	What to write	What it does
Store, Date Required	Where and when. e.g. Raw store	
Reason Required	Damaged, Expired, Found, Lost or stolen, Sample, Correction, Transfer shortage. e.g. Damaged	
Note Optional	Anything. e.g. Torn bags	
Lines: Item, Batch, Bin Required	Which stock. e.g. Sugar, SG-1101	
Change (+ found, - out) Required	Plus for found, minus for written off. e.g. -5	
Unit, Unit cost (found stock), New batch no, Expiry Sometimes	For stock found: its cost and batch.	Empty cost: the average cost.

See the effect first
While it is a draft or waiting, each line shows **In store now** and **After this** - for example 30 KG → 25 KG. **Send for approval**; nothing changes until the approver presses **Approve and post**. A mistake after that: **Reverse** it with a reason.

Step 15 · Stock count

Where: Inventory → Stock → Stock counts → New

What it is: To make the software match the shelves of a whole store.

You need first: the store.

1. **Start**: the store and the date. The software's quantities are frozen on the lines.
2. **Count**: type the counted quantity on each line (in the base unit) or scan the labels; **Save**. Found something not on the list: **Add** (item, batch, bin, counted).
3. **Not found = 0** sets every line not counted to zero.
4. **Send for approval**; the approver sees every difference and presses **Approve**: the differences are posted as one stock adjustment.

Step 16 · Reports

Where: Inventory → Reports

What it is: Every report has dates, filters, search, pages, Excel and PDF; money only with "See stock costs and values". 28 reports in five groups.

Overview: what happens, day by day

Report	What it shows
Daily summary	Each day or month in money: bought, made, used in making, sold (at cost), returned, adjusted; the sales, the profit and the stock value at the close.
Profit	Sales less the cost of the goods, for **every** sale delivered (with or without an invoice): by item, customer, day, month, or sale by sale. Profit on the goods only - salaries and rent are not taken off.
All stock movements	Every in and out of every item in plain words (Bought, Made, Used in making, Sold, Moved, Adjusted...), with document, batch, cost and **who**. Filter by kind of move and by person.
Activity log	Who did what and when in the whole software - stock, production, buying, selling, people, salary, devices - with what changed (price: 90 → 95). Only the owner, a company admin or an auditor.

Stock, buying, making, selling

Report	What it shows
Damaged, lost and written off	Stock adjusted out (damaged, expired, lost, samples), count differences, material wasted in making, damaged output and failed productions - with why, value and who.
Quality checks	Batches passed and failed in the dates, and every batch waiting for its check now.
Batch trace	Pick one batch: back to its supplier or to the material batches it was made from, and forward to the customers and products it went to, and what is left in stock. For a recall.

Report	What it shows
Purchases by supplier	From each supplier: at its price, VAT and delivery, real cost, returned, still to come on open orders; or by supplier and item.
Sales by item	Which products and bottle sizes sell most: quantity, in packs, customers, sales and share.
Below-cost sales and price changes	Sales under what the goods cost, with the reason; or every sale price change, old and new, and who made it.
Stock on hand	What is in each store now, by item and batch.
Stock ledger (item card)	Every movement of one item in a period, with the running balance.
Movement summary	Opening, in, out and closing per item for a period.
Stock valuation	What the stock is worth on a date, at average cost.
Batch and expiry	Batches with their expiry; what expires soon.
Stock aging	How long stock has been sitting.
Slow and non-moving stock	Items that have not moved for a while.
Reorder report	Items below the stock to keep, and how much to buy or make.
Purchase register / GRN register	Orders and goods received in a period.
Consumption by department	What each department took from the stores.
Production yield and wastage	Planned against good and damaged.
Production cost / Material use	Cost per unit against expected; materials used against the recipe.
Waste and failed productions	What was lost, and its cost.
Shortages	Materials short for the planned productions.
Sales register / Customer and item sales	Invoices in a period; who bought what.

Step 17 · What changed on 2 November 2026

Where: Everywhere in Inventory

What it is: Ten changes asked for after trying the screens: where each one is, and how it works.

Change	Where, and how it works
1. Search in every list	Every dropdown in Inventory (and its Purchase and Sales pages) has a search box: click it and type a few letters of the code or the name.
2. Where it comes from	Stock in explains the three kinds under the choice: a purchase, the first count, a customer return (see Step 5).
3. Items of the chosen store	Stock in: choose the store first; the item lists offer the items whose usual store it is, items of the store's type (raw, packaging, finished, spare) with no usual store, and anything already in it. Sell and Move stock: only what is in stock in that store. A line already filled keeps its item.
4. VAT, delivery and the total	Stock in, a purchase: each line shows quantity x cost and its real cost; under the lines the subtotal, VAT (% or amount), the delivery cost and the total paid (see The real cost).
5. Materials by type	Inventory → Materials: tabs All materials, Raw materials, Packaging, Finished goods, each with how many; the tiles above open a tab.

Change	Where, and how it works
6. The last price counts	The cost typed on a purchase becomes the item's buy price, and the cost of one (prices, margins, recipes) is the last price paid - not an average of old and new stock. Inventory settings → Cost used for prices and recipes can go back to the average. The stock's value stays at average cost.
7. General and spare items	Explained below, with dots on where they fit.
8. Several recipe materials	Add material on the recipe: choose several in one search list; each gets its own quantity and wastage.
9. Cost of one batch	Each material on its own row with its sum written out, and how the batch, one unit and one pack are worked out (Step 4).
10. Made but cannot sell	Sell says it at once: "Ready to sell: 0 PCS - 500 PCS waits for a quality check: pass it first", with a link to Quality check (see Step 11).

Why the average cost was 2.76 (the 250 ml bottle)
On Stock in the cost box says **Tk per BOX** when the unit is BOX. 10 BOX at 4 Tk **per BOX** is 40 Tk for 240 bottles (0.17 each); then 500 PCS at 4 Tk each is 2,000 Tk. 740 bottles for 2,040 Tk = **2.76** each on average. For 4 Tk a bottle, the box costs 96 Tk (24 x 4): write 96 per BOX, or choose PCS.
Now the cost of one is the last price paid (4.00), so prices and recipes follow the latest bill.

General items and spare parts

Besides materials and products, a factory keeps two more kinds of things. They are counted, bought and taken out of a store like the others, but they never go into a recipe and are never sold:

Kind	What it is	Examples	How it moves
Spare parts	Parts kept to repair the machines.	Bearing 6205, V-belt, motor, filter, seal	Stock in (purchase) → Spare parts store → Store issue to Maintenance when a machine is repaired.
General items	Everything else the company uses up that is not part of the product.	Gloves, cleaning liquid, printer paper, toner, tea, light bulbs	Stock in (purchase) → General store → Store issue to the department that uses it.

Where they fit (the dots)
- Setup → Item categories: a category of type **Spare part** or **General**.
- Stores & Bins → Stores: a store of kind **Spare parts** or **General** (optional: one store can hold them).
- Inventory → Materials menu → **Spare parts** / **General items**: add them there.
- Stock in: buy them like any item. Store issue (Requisitions): a department takes them out.
- Reports → Consumption by department: what each department used.
- They are not on Materials (raw, packaging) or Products, not in recipes, not on Sell.

Step 18 · Sell it as it is and in bottles

Where: A product made here → card **How you sell it**

What it is: Make the juice once in bulk (ML), then sell it three ways at the same time: the liquid by the ML or L, bottles by the PCS, and bottles by the CARTON. Each bottle size is a product of its own, with its own stock, cost, price and batches.

You need first: the bulk product made here, with its recipe; the empty bottles, caps and labels as packaging materials (Stock in).

Sold as	Holds	Cost of one	Sale price	Margin
As it is - by the ML and the L	-	0.27 / ML	0.40 / ML	32.5 %
Orange Juice 250 ml - by the PCS and the CARTON (24)	250 ML	73.60 / PCS	95.00 (= 0.38 a ML)	22.5 %
Orange Juice 1 L - by the PCS and the CARTON (12)	1,000 ML	274.10 / PCS	300.00 (= 0.30 a ML)	8.6 %

1. **Add a bottle size** on the card: one bottle holds (250 ML), counted in (PCS), the **empty** bottle, cap and label, a bottling cost (optional). The box **Cost of one filled bottle** adds them up as you choose: juice 250 x 0.27 = 67.50 + bottle 3.20 + cap 0.90 + bottling 2.00 = **73.60**.
2. Then **Sale price of one filled bottle** (optional): the margin shows as you type; below cost is refused. Bottles in a carton (optional). **Add**: the product, its recipe for 1 bottle and the carton are made in one go.
3. **Fill bottles** on its row: how many bottles → Plan, Start, Finish, as for any production. The juice and the empty bottles, caps and labels leave stock; the filled bottles come in as their own batch.
4. **Sell** on any row opens a sale with it on line 1: liquid in ML or L, bottles in PCS or CARTON - several lines on one sale if you like. Each takes from its own stock.

Two different prices
The **Sale price** card of the empty bottle (a material) is only for selling empty bottles themselves. Making uses what you **paid** for it (the last price paid), never that price.
The price in the bottle dialog is for one **filled** bottle: juice and bottle together.

Step 19 · What changed on 3 and 4 November 2026

Where: Everywhere in Inventory

What it is: Asked for while making orange juice in bulk and bottling it.

Change	Where, and how it works
1. Make any amount	Make → **How much to make** in the product's unit (125,000 ML), not a number of batches; the recipe says what quantity it is for (Recipe for 10,000 ML) and every material is scaled.
2. One production, one batch	The 1st production is batch 1, the 2nd is batch 2 - whatever their amount. The switch **Batch number per mix** is gone (it made 13 batch numbers for 12.5 times the recipe), and the Batch number box is always on Finish.
3. How you sell it	On a product made here: the bulk and every bottle size, each with cost, price, margin, stock and carton, with Add a bottle size, Fill bottles and Sell (Step 18).
4. Cost of one filled bottle	The bottle dialog shows the cost before asking the price, and the margin of the price as you type.
5. Damaged come off Good	Finish: typing Damaged lowers Good to planned - damaged; Good + Damaged above the plan needs a reason (Step 7).
6. Ten new reports	Daily summary, Profit, All stock movements, Activity log, Damaged/lost/written off, Quality checks, Batch trace, Purchases by supplier, Sales by item, Below-cost sales and price changes (Step 16).

Questions people ask

When	What happens
I don't know the price when adding	Right: no price is asked. Buy it (Stock in), then set the price.
I typed a price below cost	Refused, with the loss shown. Fix it, or Sell below cost with a reason.
A material is only in another branch	It shows as short: move it first (Move stock).
A batch expires before Start	It is not taken; the next batch is.
Nothing good came out	Finish with 0 good and a reason: a failed production, its cost a loss.
A mistake after Finish	Reverse it (a reason) while nothing made was touched.
Delete an item	Only while it has never moved and is in no recipe; else Deactivate.
Where is Opening stock?	Stock in → Where it comes from: First count (opening stock).
I made 500 but cannot sell 480	The product has Quality check before use: the batch waits. Stock → Quality check → Pass, then sell. Not checking quality? Untick it on the product (Edit).
The cost went down after buying	Look at the unit beside the cost (Tk per BOX or per PCS).
The cost is more than I wrote	The real cost has the delivery and the VAT added (see The real cost). The goods receipt shows each line's share.
An item is missing from the list	The store chosen above does not keep it: choose its store, or set the item's usual store (Edit).

When	What happens
No "See costs"	Quantities only: no money on any screen.
Damaged 25, but stock is still 500	Good was left at 500: Good is only what goes into stock. Now typing Damaged lowers Good by itself. For one already finished: Reverse it (while nothing was sold) and finish again.
Why 13 batch numbers?	The old switch Batch number per mix. It is gone: one production is one batch.
Where do I see my profit?	Reports → Profit (every sale) and Daily summary (each day in money).
Who changed this price?	Reports → Activity log, or Below-cost sales and price changes → Price changes.
A customer complains about one bottle	Reports → Batch trace: its juice batch, the pulp, sugar and bottles it was made from, and every customer who got the same batch.
