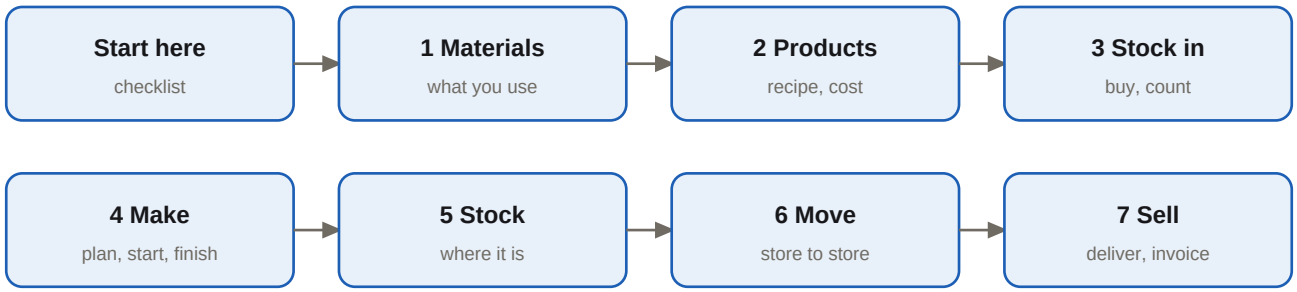
Products and stock

From materials to a sale: adding materials and products, the recipe and what one batch costs, stock in, making, stock, moving stock between stores, selling, and warranty.

For owners, store managers, store keepers, production and sales staff. Read it once from top to bottom; after that, use each step while you work. Every page ends with a **Next step** box: it always says what to do next.



How every screen behaves

- **The flow bar** at the top of every page is the menu in the order of the work. Materials and Make show only when your company has Production; Warranty only when it is on.
- **Saving never reloads the page.** The answer appears just above the Save button: green when saved, red when not - and each wrong box is outlined red with its reason under it. What you typed stays.
- **Each value is asked once.** The unit is set on the item; every quantity after that shows it beside the box. Lists offer only what fits: a store's batches, an item's own units.
- **Every list** has SL numbers, Show N, search and pages. Click a name to open it.
- **Money** (costs, values, margins) shows only to people given "See stock costs and values".

Words used on the screens

Word	What it means
Store	A warehouse or room: raw store, packing store, main store, depot. A branch can have many.
Material	Something you buy and use up making products: flour, sugar, wrappers, cartons.
Product	Something you sell. It is bought ready, made here, or both.
Unit	What stock is counted in, set once per item: packet, kg, piece.
Bigger unit	1 carton = 24 packets; 1 bag = 50 kg. A carton can have its own price.
Batch (one mix)	The recipe is written for one batch: "1 batch = 10 cartons". Making 50 cartons is 5 batches.
Batch number	Stock that came in together (one delivery, one production), with its own dates, expiry and cost. The batch that expires first always goes first.
Production	One making of a product, in three steps: Plan, Start, Finish.
Stock to keep	Below it an item shows Low. A quantity, or (products) days of sales.

Before you start (once)

1. **Switches** (the platform owner): Store & Inventory on; Production on for a company that makes things. A company that only buys and sells never sees materials, recipes or production.
2. **Inventory settings**: average cost for the whole company or per store, expiry warning days, label sizes, and **Warranty** (off by default).
3. **Units** (Add standard units adds KG, PCS, CARTON, BAG ...), **Item categories**, **Stores** (each in a branch, with its type: raw, packaging, finished goods, quarantine, rejected), **Suppliers** and **Customers**. These pages are in the Inventory menu.
4. **Access**: who may set up items, plan, start and finish production, receive goods, move stock, sell, see costs, record warranty claims (Organisation → Access).

The whole workflow, from the first material to the sale

One example from start to end: a biscuit factory. **One batch** (one mix) makes **240 packets = 10 cartons** and uses flour 18 kg, sugar 5 kg, 240 wrappers and 10 cartons. The button names are the ones on the screens. Part A is done **once**; Part B is what you do **every time** you buy, make and sell.

> **Part A is once; Part B is every time**
> The **Start here** checklist (4 / 7 steps ...) only tracks Part A and your first production and first sale. Once those are ticked you never need it again: every day you go straight to Stock in, Make and Sell.

Part A · Once: set up

#	Where you click	What you type or choose	What you see
A1	Inventory → **Units** → Add standard units. Inventory → **Stores** → Add store	Stores: Raw store (raw), Packing store (packaging), Main store (finished goods), each in its branch.	The units (KG, PCS, BAG, CARTON ...) and the rooms stock is kept in.
A2	Flow bar **1 Materials** → **Add material**	Type Raw material, name Flour, category, unit KG, Bought in BAG, One of those holds 50, stock to keep 200, usual store Raw store, Keeps batches + Has an expiry date. Press **Add material**. Do the same for Sugar (KG), Wrapper and Carton (type Packaging, unit PCS).	"RM-0001 Flour added" above the button; the material's page opens. Code left empty is given (RM-0001).
A3	Flow bar **2 Products** → **Add product**	How you get it: Make it here. Name Biscuit 100 g, smallest unit you sell PCS (the packet), sale price 20; also sold as CARTON, one holds 24, its sale price 450. Stock to keep 5,000 (or days of sales). Keeps batches, expiry, shelf life 180 days, new stock goes to Main store. Press **Add product**.	The product page opens, asking for its recipe.
A4	On the product page, card **Recipe**	"One batch makes": 240 (PCS) → **Save**. Then **Add material**: Flour 18 (KG), wastage 2 %; Sugar 5; Wrapper 240; Carton 10 - each **Add**.	"Recipe: one batch makes 240 PCS"; each line with its cost, what is in stock and "enough for N batches".
A5	Inventory → **Cost rates** → **Add rate**; then the product → card **Cost of one batch** → **Add cost** (optional, for the full cost)	Rates: Line worker, People, 75 per hour; Oven, Machine, 300 per hour. Costs: People 4 x 1.2 h x Line worker; Machine 0.5 h x Oven; Fixed per batch: Gas 120.	Total for one batch, cost per PCS and per CARTON, margin per PCS. The Cost tile shows the expected cost.

Part B · Every time: buy, make, sell

#	Where you click	What you type or choose	What you see
B1	Flow bar **3 Stock in** → **Stock in**	Where it comes from: A purchase (the very first time: First count). Supplier, Into store: Raw store, date. Lines: Flour 10 BAG, cost 2,600 per BAG, batch number, expiry; Sugar 50 KG ...; Wrapper 5,000; Carton 300. **Add a line** for more. Press **Put in stock**.	"GRN-...: 4 lines received into Raw store". The list shows it; Materials show OK instead of Out.

#	Where you click	What you type or choose	What you see
B2	Product page → **Make this** (or **Make N batches** on the Suggested card, or flow bar **4 Make**)	How many batches: 5; date; products go into Main store.	The materials table: needed (wastage included), usable in the branch, taken from which store, Enough or **Short by**. Short: **Make fewer** or **Buy the rest**.
B3	Plan page → **Plan it**	-	"PRD-... planned: 5 batches." The production page opens at step 2 Start.
B4	Production page → **Start: materials out** (when the store gives the materials)	Change a "Given" quantity only if a store gave more or less (over 5 % needs a reason).	"Started: the materials left the stores"; Raw store stock goes down; the page moves to step 3 Finish.
B5	Production page → **Finish: into stock** (when the batches are done)	Good 1,180, Damaged 20 (PCS). Into Main store 1,180 (or split across stores). Leftover flour back 1 KG. Other costs filled from the cost sheet x 5 - correct them if the day was different.	"PRD-... finished: 1,180 PCS into stock as batch ...". Cost per PCS against the expected cost; the batch is in Main store.
B6	Flow bar **5 Stock**	Filters if you like: store, type, status.	Biscuit 100 g: 1,180 PCS (49.17 CARTON) in Main store, its value, and what expires first.
B7	Flow bar **6 Move stock** → **Move stock** (only if it is sold from another store)	From Main store, To Depot, Biscuit 20 CARTON. **Send it**. At the depot: **Receive** on the list.	"ST-... sent" - in transit - then received in Depot.
B8	Flow bar **7 Sell** → **New sale**	Customer, From store Main store, date, tick Make the invoice now. Line: Biscuit 100 g, 10, unit CARTON; price empty (the customer's price list, else 450). Press **Sell and deliver**.	"SO-... delivered as DC-..., invoice INV-...". Stock goes down from the batch that expires first. Done.

Next time
Only Part B: **Stock in** when materials arrive, **Make** (plan, start, finish) when you produce, **Sell** when you sell. The product page tells you how many batches to make, and Start here lists what is below stock to keep.

Step 0 · Start here

Where: Inventory → Start here (the flag in the flow bar)

What it is: The first page: tiles (materials and products low or out, the value in stock, set-up steps done), the **What to do** checklist and the latest productions.

The checklist is worked out from your own records, and each line opens the page where it is done:

- Stores set up
- Materials added (Production)
- Products added
- Recipes saved (Production)
- Stock in
- First production finished (Production)
- First sale delivered
- Below stock to keep - the items to buy or make now

Next step
The box at the bottom always names the first thing not done yet, with one button to it.

A one-time checklist
The ticks and "4 / 7 steps done" are worked out from your records - nobody ticks them. They track setting up and your first production and first sale; once done they stay done. You do **not** go through it each time you produce: for that, use Stock in, Make and Sell (Part B of the workflow). Two lines can come back: Recipes saved (a new product you make has no recipe yet) and Below stock to keep (an alert).

Step 1 · Materials

Where: Inventory → Materials (flow bar 1) Only with Production on.

What it is: What you buy and use up in production: raw materials and packaging. The list shows each one with what is in stock (in the stores you see), stock to keep, value and a status chip: **OK**, **Low**, **Out**. Filters: category, store, status.

You need first: units, categories and stores.

Add material

Box on screen	What to write	What it does
Type Required	Raw material or Packaging. e.g. Raw material	Decides which categories are offered and where it shows.
Name Required	What everyone calls it. e.g. Flour	Shown on every list, document and label.
Code Optional	Leave it empty, or write your own. e.g. RM-0012	Empty: the next number is given (RM-0012 after RM-0011). Must be unique.
Category Required	One of the material categories. e.g. Dry goods	Groups it in lists and reports.
Unit Required	What stock is counted in. e.g. KG	Every quantity of it is in this unit. It cannot change once stock has moved.
Bought in / One of those holds Optional	A bigger unit you buy it in, and its size. e.g. BAG, 50	Purchases can be entered in bags; the stock stays in kg.
Stock to keep Optional	The least you want in stock. e.g. 200	Below it the material shows Low, is in the morning email and the reorder report.
Usual store Optional	Where it is normally kept. e.g. Raw store A	Production takes it from this store first, then the other stores of the branch.
Keeps batches / Has an expiry date / Shelf life Optional	Switch on for food, chemicals ... e.g. on, 180 days	Each delivery becomes a batch number with its dates; expired stock can never be used.
Quality check before use Optional	Switch on when new stock must be checked.	New stock waits in quarantine until it passes.

Material page (click its name): in stock, average cost, how many products use it; stock by store and batch; **Used in**; its units. **Edit** changes it; **Delete** appears only while it has never moved - after that it is

Deactivate.

Step 2 · Products

Where: Inventory → Products (flow bar 2)

What it is: What you sell. The list shows how you get each one (Buy / Make / Both), what is in stock (also in cartons), the sale price, the cost per unit, the margin and a status chip.

Add product

Box on screen	What to write	What it does
How you get it Sometimes	Make it here, Buy it ready, or Both. e.g. Make it here	Only with Production. Make and Both get a recipe, a cost of one batch and the Make button.
Name, Code, Category Required	As for materials (code empty: FG-0001 ...). e.g. Biscuit 100 g	
Smallest unit you sell Required	The unit stock is counted in. e.g. PCS (packet)	Fixed once stock moves.
Sale price Required	For one of that unit. e.g. 20	Used on sales unless the customer's price list says else.
Also sold as / One of those holds / Its sale price Optional	A bigger unit, its size and its own price. e.g. CARTON, 24, 450	A carton need not cost 24 x the packet price: sales use 450.
Stock to keep as Optional	A quantity, or days of sales. e.g. Days of sales: 15	Days: worked out from the last 30 days of deliveries (less returns). Used for Low and to suggest how much to make.
New stock goes to Optional	The finished goods store. e.g. Main store	Offered first when planning a production.
Keeps batches / expiry / shelf life Optional	As for materials. e.g. on, 180 days	A made batch expires made date + shelf life.
New batch number for every batch made Optional	On: one batch number per mix.	Off: one batch number per production. On: one per mix, into one store.
Warranty (months) / A serial number for each unit Optional	Only when Warranty is on. e.g. 12	See step 8.

Product page: tiles (cost per unit - the expected one for a made product - sale price, margin, in stock, sold in the last 30 days and per day); the suggestion how many batches to make; the recipe; the cost of one batch; stock by store and batch; its productions (or purchases); units and prices.

Step 2b · Recipe and cost of one batch

Where: Products → open the product → Recipe / Cost of one batch

What it is: What one batch makes and uses, and what one batch costs: materials plus people, machines and other costs. It gives the expected cost per unit, per carton and the margin.

You need first: the product (Make or Both) and its materials.

1. With no recipe yet the page asks **how much one batch makes** (in the product's unit): write it and Save.
2. **Add material**: one already added, a **new** one made right there (type, name, code, category, unit), or a **product made here** (semi-finished, like cream for cream biscuits). Write how much **one batch** uses - the material's own unit is shown - and its normal wastage %.
3. Each line shows its cost, what is in stock and how many batches that is enough for. **Remove** takes it off; **Batch size** changes what one batch makes.
4. **Cost rates** (Inventory → Cost rates): what an hour costs - Line worker 75, Oven 300. A change counts for productions after it.
5. **Add cost** on the product: people x hours x rate, machine hours x rate, a fixed amount per batch (gas), or a % of the materials (rent share). Only the boxes of the chosen way show.

What you read
Materials (the recipe x each material's average cost, wastage included) + the costs = **one batch**; divided by what one batch makes = **one unit**; x 24 = one carton. Margin = sale price - cost per unit.
A material with no cost yet is named in red: the total is short until it has one.

Refused
The product itself, a product that is made with this one (a loop), a product bought ready, the same material twice.

Step 3 · Stock in

Where: Inventory → Stock in (flow bar 3) → Stock in

What it is: Everything that comes into a store. The list shows purchases, first counts and customer returns together; click a number to open the document.

You need first: suppliers and customers; the items.

The form

Box on screen	What to write	What it does
Where it comes from Required	A purchase, the first count, or a customer return. e.g. A purchase	Decides the boxes below and the document it makes.
Supplier / Customer Sometimes	Who it came from (purchase / return). e.g. Sweet Mills	
Into store, Date Required	The store it arrived at, and the day. e.g. Raw store A	A closed month is refused.

Box on screen	What to write	What it does
Why it came back Sometimes	For a return. e.g. Wrong order	
Item, Quantity, Unit Required	One line per item; Add a line for more. e.g. Flour, 10, BAG	Only the item's own units are offered; stock is counted in its unit.
Cost Sometimes	Purchase and count: per the unit chosen. e.g. 2,600 per BAG	Sets the average cost.
Batch number, Expiry date Sometimes	Only for items that keep them. e.g. FL-231026, 1 Apr 2027	Batch empty: one is made. Expiry needed for items that expire.
Condition Sometimes	Return: good or damaged. e.g. Damaged	Good: back to stock. Damaged: the rejected store.

What happens on Put in stock
A purchase is received and posted at once (items needing a quality check wait in quarantine). A first count is posted when you may approve opening stock; otherwise it waits for whoever may. A return is posted. If any line is refused, nothing is saved - the line and box are named.

Step 4 · Make: Plan, Start, Finish

Where: Inventory → Make (flow bar 4), or **Make this** on the product Only with Production on.

What it is: A production makes a number of batches of a product. Plan it, Start it when the materials leave the stores, Finish it with what came out.

You need first: the recipe, and the materials in stock.

Plan

1. The product page suggests: **stock to keep - in stock - what is planned = batches wanted**, capped by what the materials allow. **Make N batches** opens the plan with that number.
2. Write how many batches, the date and the store the products go into. The materials table follows as you type: needed (wastage included), usable in the branch, taken from which stores (usual store first, the batch that expires first), Enough or **Short by**.
3. Short: **Make fewer** sets the most the materials allow; **Buy the rest** makes a purchase requisition for exactly what is missing; a semi-finished product offers **Make it first**. Another planned production needing the same material is named.
4. **Plan it**. A short plan can be saved; it cannot start until the materials are in.

Start

1. The production page lists what leaves each store. Change a quantity only if a store gave more or less; more than 5 % over the plan needs a reason.
2. **Start: materials out**: stock goes down in each store at its real cost. Refused while anything is short.

Finish

Box on screen	What to write	What it does
Good / Damaged Required	What came out. e.g. 1,980 / 20	Good below 90 % or above 105 % of the plan needs a reason. 0 good = a failed production (reason; its cost is a loss).
Into which store Required	One store, or split. e.g. Main 1,950 + Depot 30	Must add up to Good.
Back to the store / Wasted / Why Optional	Leftover material. e.g. Pulp 5 back; sugar 1 wasted, spilled	Back: into the store and batch it came from, at the cost used. Wasted needs a reason.
Other costs Optional	Filled from the cost of one batch x batches; correct them. e.g. Line worker 900, Gas 240	Added to the materials actually used.
Batch number, Date, Why Sometimes	Batch empty: one is made.	

The result
Cost per unit = (materials used + other costs) / good; damaged carry no cost of their own. The new batch is valued at it; the page shows it against the expected cost.
Reverse (a reason) while nothing made was sold, moved or used: everything goes back. **Return the materials and cancel** after Start. **Quality check** when the product needs one.

Step 5 · Stock

Where: Inventory → Stock (flow bar 5)

What it is: Every item in stock: how much (also in cartons), in which stores, stock to keep, value and status; and the batches that expire first (within the warning days of Inventory settings). **By store, bin and batch** opens the detailed page.

Step 6 · Move stock

Where: Inventory → Move stock (flow bar 6) → Move stock

What it is: Stock sent from one store to another.

You need first: the stores.

1. From store, To store (never the same), date.
2. Each line: item, quantity, unit, and the batch if you want a given one (else the one that expires first). "In the store" shows what the From store has.
3. **Send it**: the stock leaves and waits **in transit**.
4. When it arrives, the other store presses **Receive** on the Move stock list.

Step 7 · Sell

Where: Inventory → Sell (flow bar 7) → New sale

What it is: A sale to a customer, delivered at once from one store, and invoiced when asked.

You need first: customers (and their price list, if any), stock in the store.

1. Customer, From store, date. Tick **Make the invoice now** if you invoice.
2. Each line: product, quantity, unit (packet or carton). Price: leave it empty for the customer's price list (else the carton's own price, else the product's price) - the product's price is shown as a hint.
3. **Sell and deliver**: the sale is confirmed and delivered, the batch that expires first going first. Over the credit limit: say why in the box. More than the store has: refused, nothing saved.
4. Someone who may not confirm their own sales leaves it saved for whoever confirms.

Step 8 · Warranty

Where: Inventory → Warranty (only when switched on)

What it is: Items with a warranty, their serial numbers and claims.

You need first: Inventory settings → Warranty on; Warranty (months) on the items.

1. **Serial numbers**: made by themselves when a production of an item with serial numbers finishes (Print serial labels on the production); **Serial numbers in** for units you received.
2. **Serial numbers out**: choose the delivery and scan each unit as it leaves - the warranty runs from that day for that customer.
3. **New claim**: scan the serial - the form says *covered until ...* or *out of warranty since ...*. Without a serial: the item and when it was delivered.
4. What you do: replace, repair (its cost), refund (the amount) or refuse (why). Covering one out of warranty needs a reason. The faulty unit can go into the rejected store; a new unit leaves a store.

Reports
Inventory → Reports: **Production cost** (cost per unit against expected), **Material use**, **Waste and failed productions**, **Shortages**, plus stock on hand, valuation, batch and expiry, reorder, purchase and sales registers. Each with filters, Excel and PDF.

Questions people ask

When	What happens
A material is in two stores of the branch	Production takes from both: the usual store first.
A material is only in another branch	It shows as short: move it first (Move stock).
Two plans need the same stock	Both are warned; the first to start takes it.
A batch expires before Start	It is not taken; the next batch is.
A batch waits for its quality check	It is never used or sold until it passes.
Nothing good came out	Finish with 0 good and a reason: a failed production, its cost a loss.
A mistake after Finish	Reverse it (a reason) while nothing made was touched; else a stock adjustment.
The rate of a worker changes	Change it on Cost rates: future productions use it, finished ones keep theirs.
Delete an item	Only while it has never moved and is in no recipe; else Deactivate.
Someone from another branch	Sees and works only in their branches' stores.
No "See costs"	Quantities only: no money on any screen.
